This book contains a collection of latest research developments on the urban transportation systems. It describes rail transit systems, subways, bus rapid transit (BRT) systems, taxicabs, automobiles, etc. This book also studies the technical parameters and provides a comprehensive overview of the significant characteristics for urban transportation systems, including energy management systems, wi...

1. Track Gauge Degradation Modelling on Small Urban Rail Networks: Zagreb Tram System Case Study

By Meja Ahac and Stjepan Lakušić

1,906

VIEW ABSTRACT

Track gauge is the most significant tram track geometry parameter, which manifests as gradual increase of gauge deviation from prescribed value. It causes poor ride quality, reduces safety and triggers most of the maintenance procedures. To optimize tram track maintenance procedures, it is necessary to increase the preventive maintenance at the expense of corrective maintenance. This requires a physical model of track degradation. Conducted survey of conventional track degradation showed that, in order to quantify the influence of track design, construction and exploitation characteristics on gauge degradation, it is most favourable to adopt the mechanistic modelling approach. Zagreb high-capacity tram network presents an optimal testing ground for exploration of the possibilities for tram track gauge degradation model development. Available modelling results gave new, practical insights about the effects of tram track design and construction elements and exploitation characteristics on gauge degradation. These models represent the first step towards predictive maintenance system establishment on Zagreb tram

VIEW ABSTRACT ^

In this chapter, a hybrid power system that consists of a proton exchange membrane fuel cell (PEMFC) systems, batteries, and supercapacitors is proposed. Three energy management strategies that include consumption minimization strategy (ECMS), and a model predictive control (SMS-DC) are utilized to coordinate multiple power sources to deal with rapid changes of power demand, and achieve high efficiency and better performance for an energy management system of hybrid tramway. A real-time performance is established with commercially available devices, and then the different energy management strategies are evaluated with a real driving cycle of tramway from Turkey. The results compared with these strategies demonstrate that the higher average efficiencies of the tramway, the lower tramway-equivalent hydrogen consumptions, and more efficient use of the batteries and SCs energy are achieved by the SMS-DC. Therefore, the appropriate energy management system for high-power hybrid tramway will improve the hydrogen consumption.

6. The Effects of Urban Public Transit Investment on Traffic Congestion and Air Quality

By Justin Beaudoin and C.-Y. Cynthia Lin Lowell

Environment Engineering

We Also Specialize in
Plant Engineering
and Piping Design

To Engineering Smart

VIEW ABSTRACT

Traffic congestion is ubiquitous across urban roadways and the accompanying deteriorating air quality are an ongoing problem. Transportation is also a major contributor of greenhouse gas emissions, an element of the climate change debate. A contentious issue for urban analysts and policy-makers is what the effects of public transit investment on air quality are and therefore what the appropriate level of public transit contribution to sustainability, there have been relatively few studies. The effects of public transit investment on traffic congestion or air quality. In this chapter, theoretical and empirical research on the effects of public transit investment on demand for automobile travel, and air quality.

5. Characterisation of Airborne Particulate Matter in Different European Subway Systems

By Vânia Martins, María Cruz Minguillón, Teresa Moreno, Luís Mendes, Konstantinos Eleftheriadis, Célia A. Alves, Eladio de Miguel and Xavier Querol

1,938

VIEW ABSTRACT

Air quality sampling campaigns in three European subway systems (Lisbon, Porto and Oporto) were conducted in order to characterise particulate matter (PM) and its main factors controlling it. PM mass concentrations varied among the European platforms, and also within the same underground system, this being mainly due to differences in the design of the stations and tunnels, system age, train frequency and air-conditioning systems, commuter's density, rails geometry and outdoor air-quality concentrations displayed clear diurnal patterns, depending largely on the operation and frequency of the trains and the ventilation system. Chemically, subway PM_{2.5} on the platforms consisted of iron, carbonaceous material, crustal matter, secondary inorganic compounds, insoluble sulphate, halite and trace elements. Fe was the most abundant element, accounting for 16% of the bulk DM_{2.5}, which is associated with iron from mineral matter.

VIEW ABSTRACT ^

The book chapter presents a statistical analysis of historical pedestrian A&B accidents that have occurred in Mexico City from 2005 to 2012. The most critical years have been 2008, 2011 and 2012; the least critical year, on the other hand, has been 2010; (b) overall, the frequency of accident occurrence has been decreasing in both the most critical seasons of the year have been the following: autumn (27.7% in line A and 20.0% in line B); (d) the frequency of accidents increases when approaching the end of the workday (Thursday and Friday) and the frequency of accidents decreases sharply at weekends (Saturday and 54.47% of accidents have occurred at the three peak (i.e. morning, afternoon, evening) night in lines A and B, respectively; (f) 64.8% (22/73) of pedestrians have been killed when collided with the BRT buses; and (g) the most critical section of the BRT lane has been identified with 17

VIEW ABSTRACT ^

This chapter describes a procurement process for providing transport services for passenger transport. The objective of the chapter is to present the steps of the procurement process for public transport services. These steps consist of identification of requirements, identification of requirements for transport serviceability, risk allocation between contracting parties, public service contract and a process of selecting a service operator, identification of risks and their influence on contracting parties. The chapter also characterizes the process of direct award of a public service contract, that is without competitive tendering. The objective is to define the impact of the direct award of contracts on the scope of services provided.

VIEW ABSTRACT ^

The demand for urban transport quality is typically always financing possibilities and authorities. Financing urban transport has always been a task of local government authorities because of the necessity to connect the different parts of the city and enable time saving and thus better quality of life for its citizens. The changes in the twenty-first century when the citizen requirements for urban transport connectivity are coupled with smart, intermodal and energy-efficient financing problem of urban transport is somewhat simpler in very public areas as the growing number of public transport users continuously finance urban transport renewal. However, less developed areas have to have integrated pricing and social policies for the end users of urban transport, which often turns to be unsustainable in the long run in time. Depending on the project size, financial strength of municipalities and the type of urban transport infrastructure construction and maintenance are typically financed from national or local state funds or borrowing. Some urban transport lines can also be given in concession. Financing urban transport encompasses either financing urban transport infrastructure construction or financing fleet renewal, or combined financing of both urban

VIEW ABSTRACT ^

Recently, the ride-sharing services have become very popular in urban areas. The rise of dynamic ride sharing startups have challenged the traditional taxicab market. Those dynamic developments within urban transportation market have substituted for cab services, it has been controversial in the past. Some policy makers argue that ride-share will lead to the death of public transportation and does not intervene in this area. However, market developments suggest that competition between those urban transport modes has led to the dramatic increase in consumer welfare and economic efficiency have improved. Examining the impact of ride share on the traditional taxicab market, this chapter concludes that ride share introduces a unique opportunity for the users of urban transport, but not threat. However, a mixed regulatory structure including deregulation and regulation policies is needed to improve market welfare in both markets. While economic regulations such as fare controls and entry restrictions are not necessary for both ride shares and taxicabs, social regulations are still crucial to improve the satisfaction of users of rideshare and taxicab services in terms of the quality of service.
